## Lec 16

$$\begin{aligned} 1 \quad (1) \quad \frac{d}{dx} F(x) &= e^{x\sqrt{1-\cos^2 x}}(-\sin x) - e^{x\sqrt{1-\sin^2 x}}(\cos x) + \int_{\sin x}^{\cos x} \sqrt{1-y^2} e^{x\sqrt{1-y^2}} dy \\ &= \int_{\sin x}^{\cos x} \sqrt{1-y^2} e^{x\sqrt{1-y^2}} dy - e^{x|\sin x|} \sin x - e^{x|\cos x|} \cos x \end{aligned}$$

$$(2) \quad \frac{d}{dx} F(x) = \int_{x^2}^x f(x, s) ds + \int_0^x 2xf(t, x^2) dt = \int_0^x 2xf(t, x^2) dt$$

$$2 \quad F(x) = \frac{1}{2\pi} \int_0^{2\pi} \frac{e^{x \cos \theta} (e^{ix \sin \theta} + e^{-ix \sin \theta})}{2} d\theta = \frac{1}{2\pi} \int_0^{2\pi} \frac{e^{xe^{i\theta}} + e^{xe^{-i\theta}}}{2} d\theta$$

$$F'(x) = \frac{1}{2\pi} \int_0^{2\pi} e^{i\theta} \frac{e^{xe^{i\theta}}}{2} d\theta + \frac{1}{2\pi} \int_0^{2\pi} e^{-i\theta} \frac{e^{xe^{-i\theta}}}{2} d\theta = 0$$

$$\therefore F(x) = \text{const}, \quad F(x) = F(0) = 1$$

$$3 \quad I = - \int_0^1 \sin(\ln x) \int_a^b xy dy dx = - \int_a^b \int_0^1 \sin(\ln x) x^y dx dy$$

$$= \int_a^b \frac{1}{(y+1)^2+1} dy = \arctan(b+1) - \arctan(a+1)$$

$$4 \quad F(x) = \frac{1}{h^2} \int_0^h \left[ \int_0^h f(x+\xi+\eta) d\eta \right] d\xi = \frac{1}{h^2} \int_x^{x+h} \left[ \int_\xi^{\xi+h} f(\eta) d\eta \right] d\xi$$

$$F'(x) = \frac{1}{h^2} \left[ \int_{x+h}^{x+2h} f(\eta) d\eta - \int_x^{x+h} f(\eta) d\eta \right]$$

$$F''(x) = \frac{1}{h^2} \{f(x+2h) - f(x+h) - [f(x+h) - f(x)]\}$$

$$= \frac{f(x+2h) - 2f(x+h) + f(x)}{h^2}$$

□

## Lec 17

$$1 \quad (1) \quad \because \left| \frac{\cos xy}{x^2+y^2} \right| \leq \frac{1}{a^2+y^2}, \quad \int_0^\infty \frac{1}{a^2+y^2} dy \text{ converges}$$

$\therefore$  uniformly converges

$$(2) \quad \because \int_0^{+\infty} \frac{\sin x}{x} dx = \frac{\pi}{2} \text{ uniformly converges, } e^{-\alpha x} \text{ is about } x \text{ monotonically decreasing and}$$

$$|e^{-\alpha x}| \leq 1$$

$\therefore$  uniformly converges

$$(3) \quad \because f(x) = \begin{cases} \frac{1}{\sqrt{2\pi}}, & x > 0 \\ 0, & x = 0 \end{cases}$$

$\therefore$  not uniformly converges

$$(4) \quad \int_0^1 \frac{1}{x^y} \sin \frac{1}{x} dx = \int_1^\infty x^{y-2} \sin x dx$$

apply second mean value theorem for definite integrals,  $\forall N \in \mathbb{N}^*, \exists y = 2 - \frac{1}{(2N+1)\pi}$

$$\int_{2N\pi}^{(2N+1)\pi} x^{y-2} \sin x dx \leq 2[(2N+1)\pi]^{y-2} = 2[(2N+1)\pi]^{-\frac{1}{(2N+1)\pi}} > 1$$

$\therefore$  not uniformly converges

$$(5) \quad \forall \epsilon > 0, \exists \delta < \frac{1}{4}\epsilon^2 \text{ s.t. } \int_{y-\delta}^y \frac{\sin xy}{\sqrt{y-x}} dx \leq \int_{y-\delta}^y \frac{1}{\sqrt{y-x}} dx = 2\sqrt{\delta} \leq \epsilon$$

$\therefore$  uniformly converges

$$(6) \quad \int_0^1 x^{p-1} \ln^2 x dx = \int_{-\infty}^0 e^{px} x^2 dx$$

$$\because \forall N > 0, \exists p = \frac{1}{\sqrt[3]{N+1}} \text{ s.t. } \int_{-\sqrt[3]{N+1}}^{-\sqrt[3]{N}} e^{px} x^2 dx > \frac{e^{-\sqrt[3]{N+1}p}}{3} = \frac{e^{-1}}{3}$$

$\therefore$  not uniformly converges

$$2 \quad \because |F(u)| \leq \int_{-\infty}^{+\infty} |f(x)| dx = A$$

$\therefore F(u)$  is bounded

$$\forall \epsilon > 0, \exists K(\epsilon) > \frac{1}{\epsilon}, \text{ s.t. } \int_{-\infty}^{-K} |f(x)| dx + \int_K^{+\infty} |f(x)| dx < \frac{\epsilon}{3}$$

$$\exists \delta = \frac{1}{3K^2A} \text{ when } |u_1 - u_2| < \delta$$

$$|F(u_2) - F(u_1)| = \left| \int_{-\infty}^{+\infty} f(x)(\cos u_2 x - \cos u_1 x) dx \right|$$

$$\leq \frac{2}{3}\epsilon + 2 \left| \int_{-K}^{+K} f(x) \sin \frac{u_2+u_1}{2} x \sin \frac{u_2-u_1}{2} x dx \right|$$

$$\leq \frac{2}{3}\epsilon + \frac{1}{3KA} \int_{-K}^{+K} |f(x) \sin \frac{u_2+u_1}{2}x| \, dx$$

$$\leq \epsilon$$

$\therefore$  uniformly continuous □

3  $\because \int_0^{+\infty} f(t) \, dt$  uniformly converges,  $e^{-xt}$  is about  $x$  monotonically decreasing and  $|e^{-xt}| \leq 1$  ( $x \geq 0$ )

$\therefore \int_0^{+\infty} e^{-xt} f(t) \, dt$  uniformly converges

$$\therefore \lim_{x \rightarrow 0} \int_0^{+\infty} e^{-xt} f(t) \, dt = \int_0^{+\infty} f(t) \, dt$$

□
