#### Lec 04:

5 Let  $b_k$  equal to the sum of  $k^{th}$  set of successive  $a_n$  which have the same sign

If  $n_0$  is in the  $k_0^{th}$  set, denote  $k(n_0) = k_0$ 

$$\because \sum_{k=1}^{\infty} b_k \text{ convergent}, \lim_{k \to \infty} b_k = 0$$

$$\therefore \forall \varepsilon > 0, \exists K > 0, \forall k_1, k_2 > K, \left| \sum_{k=k_1}^{k_2} b_k \right| < \varepsilon, \left| b_{k_1} \right| + \left| b_{k_2} \right| < \varepsilon$$

$$\therefore \exists N, k(N) > K, \forall n_1, n_2 > N, |\sum_{n=n_1}^{n_2} a_n| \leq \varepsilon + |b_{k(n_1)}| + |b_{k(n_2)}| < 2\varepsilon$$

 $\therefore$  convergent

For 
$$a_n = \frac{(-1)^{\lceil \sqrt{n} \rceil}}{n}$$
, let  $b_k = (-1)^k \sum_{n=(k-1)^2+1}^{k^2} \frac{1}{n}$ 

$$\therefore |b_k| < \frac{2k}{(k-1)^2}$$

 $\therefore |b_k|$  monotonically decreases to 0 and  $\mathrm{sgn}(\frac{b_k}{b_{k-1}}) = -1$ 

$$\therefore b_k$$
 converges But  $|a_n| = \frac{1}{n}$ 

: conditionally convergent

$$8 \ \forall \varepsilon > 0, \exists N > 0, \forall n_1, n_2 > N,$$

$$\max\{|\sum_{n=n_1}^{n_2} n(a_n - a_{n-1})|, |n_1 a_{n_1-1}|, |n_2 a_{n_2}|\} < \varepsilon$$

$$\therefore \left| \sum_{n=n_1}^{n_2-1} a_n \right| = \left| \sum_{n=n_1}^{n_2} n(a_n - a_{n-1}) + n_1 a_{n_1-1} - n_2 a_{n_2} \right| < 3\varepsilon$$

∴ convergent □

Lec 05:

3 (1) 
$$x_{n+1} - x_n = \frac{\ln(n+1)}{n+1} - \frac{1}{2} \left[ \ln^2(n+1) - \ln^2 n \right] = \frac{\ln(n+1)}{n+1} - \int_n^{n+1} \frac{\ln x}{x} dx$$

 $\frac{\ln x}{x}$  is monotonically decreasing over  $[e, +\infty)$ 

if 
$$n > 3$$
,  $\frac{\ln(n+1)}{n+1} < \int_{n}^{n+1} \frac{\ln x}{x} \, \mathrm{d}x < \frac{\ln n}{n}$ 

 $\therefore x_{n+1} < x_n, x_n$  monotonically decreasing

$$x_n = \sum_{k=1}^n \frac{\ln k}{k} - \frac{1}{2} (\ln n)^2 = \sum_{k=1}^n \frac{\ln k}{k} - \int_1^n \frac{\ln x}{x} dx$$
$$= \sum_{k=1}^2 \frac{\ln k}{k} - \int_1^3 \frac{\ln x}{x} dx + \sum_{k=3}^n \frac{\ln k}{k} - \int_3^n \frac{\ln x}{x} dx > \frac{\ln 2}{2} - \ln^2 3$$

.: convergence

(2) 
$$x_{n+1} - x_n = \frac{1}{\sqrt{n+1}} - 2\sqrt{n+1} - 2\sqrt{n} < 0$$

 $\therefore x_n$  monotonically decreasing

$$\sqrt{n} = \sqrt{n} - \sqrt{n-1} + \sqrt{n-1} - \sqrt{n-2} + \dots + \sqrt{2} - \sqrt{1} + 1$$

$$= \frac{1}{\sqrt{n} + \sqrt{n-1}} + \frac{1}{\sqrt{n-1} + \sqrt{n-2}} + \dots + \frac{1}{\sqrt{2} + \sqrt{1}} + 1$$

$$< \frac{1}{2} \left( \frac{1}{\sqrt{n-1}} + \frac{1}{\sqrt{n-2}} + \dots + \frac{1}{\sqrt{1}} \right) + 1$$

$$x_n > 1 + \frac{1}{\sqrt{2}} + \dots + \frac{1}{\sqrt{n}} - \left( \frac{1}{\sqrt{n-1}} + \frac{1}{\sqrt{n-2}} + \dots + \frac{1}{\sqrt{1}} + 2 \right) = -2 + \frac{1}{\sqrt{n}} > -2$$

... convergence

$$4 \sum_{n=0}^{\infty} |x|^n = \frac{1}{1-|x|}, \sum_{n=0}^{\infty} |y|^n = \frac{1}{1-|y|} \text{ (both absolutely convergent)}$$

$$\therefore \sum_{n=1}^{\infty} (x^{n-1} + x^{n-2}y + \dots + y^{n-1}) = \sum_{n=0}^{\infty} x^n \sum_{n=0}^{\infty} y^n = \frac{1}{(1-x)(1-y)}$$

$$5 \lim_{n \to \infty} \sqrt[n]{n!} = \infty$$

 $\therefore$  radius of convergence is  $\infty$ 

$$\therefore \sum_{n=0}^{\infty} \frac{x^n}{n!} = e^x, \sum_{n=0}^{\infty} \frac{y^n}{n!} = e^y \text{ both absolutely convergent}$$

$$\therefore \sum_{n=0}^{\infty} \frac{x^n}{n!} \sum_{n=0}^{\infty} \frac{y^n}{n!} = e^{x+y} = \sum_{n=0}^{\infty} \frac{(x+y)^n}{n!}$$

### Lec 06:

1 (1) Let 
$$p_n = q_n = 1$$
,  $\prod_{n=1}^{\infty} (p_n + q_n) = \prod_{n=1}^{\infty} 2 = \infty$ 

∴ divergent

(2) 
$$\prod_{n=1}^{\infty} p_n, \prod_{n=1}^{\infty} q_n \text{ converge}$$

$$\Rightarrow \sum_{n=1}^{\infty} \ln p_n, \sum_{n=1}^{\infty} \ln q_n \text{ converge}$$

$$\Rightarrow \sum_{n=1}^{\infty} (\ln p_n + \ln q_n) \text{ converges}$$

$$\Rightarrow \sum_{n=1}^{\infty} \ln(p_n q_n) \text{ converges}$$

$$\Rightarrow \prod_{n=1}^{\infty} p_n q_n \text{ converges}$$

(3) Let  $q_n = p_n$  and use conclusion of previous problem

: convergent

(4) 
$$\prod_{n=1}^{\infty} q_n \text{ converges}$$

$$\Rightarrow \sum_{n=1}^{\infty} \ln q_n \text{ converges}$$

$$\Rightarrow -\sum_{n=1}^{\infty} \ln q_n \text{ converges}$$

$$\Rightarrow \prod_{n=1}^{\infty} \frac{1}{q_n}$$
 converges

Use conclusion of Lec 06 Prob 1(2),  $\prod_{n=1}^{\infty} \frac{p_n}{q_n}$  converges

2 Denote 
$$T_n = \prod_{k=1}^n (1 + u_k), S_n = \sum_{k=1}^n u_k, S'_n = \sum_{k=1}^n (u_k)^2$$

$$\therefore S_{2n} = \sum_{k=1}^{n} \frac{1}{k} \to \infty, S'_{2n} > 2 \sum_{k=1}^{n} \frac{1}{k} \to \infty$$

$$\therefore \lim_{n \to \infty} u_{2n-1} = \lim_{n \to \infty} u_{2n} = 0$$

 $\therefore S_n, S'_n$  diverges

$$\therefore (1 + u_{2k-1})(1 + u_{2k}) = 1 - \frac{1}{k^{\frac{3}{2}}}$$

 $\therefore T_{2n}$  converges, let A denote its limit

 $\therefore \forall \varepsilon > 0, \exists N_1 > 0, \forall n > N_1, |T_{2n} - A| < \varepsilon$ 

And 
$$\lim_{n\to\infty} \frac{T_{2n+1}}{T_{2n}} = u_{2n+1} + 1 = 1$$

$$\therefore \text{ for } \varepsilon > 0, \exists N_2 > 0, \forall n > N_2, |T_{2n+1} - T_{2n}| < \varepsilon$$

$$\therefore \forall \varepsilon > 0, \exists N = \max\{2N_1 + 10, 2N_2 + 10\} > 0, \forall n > N, |T_n - A| < 2\varepsilon$$

 $T_n$  converges

$$3 \ (1) \ \lim_{n \to \infty} \frac{\ln[(\frac{n^2 - 1}{n^2 + 1})^p]}{\frac{1}{n^2}} = \lim_{n \to \infty} \frac{p \ln(1 - \frac{2}{n^2 + 1})}{\frac{1}{n^2}} = -2p$$

∴ convergent

(2) 
$$\lim_{n \to \infty} \frac{\ln \sqrt[n]{1 + \frac{1}{n}}}{\frac{1}{n^2}} = \lim_{n \to \infty} \frac{\frac{1}{n} \ln(1 + \frac{1}{n})}{\frac{1}{n^2}} = 1$$

∴ convergent

(3) 
$$\lim_{n\to\infty} \frac{\ln \sqrt[n]{\ln(n+x)-\ln n}}{\frac{1}{n}} = \lim_{n\to\infty} \frac{\frac{1}{n}\ln\ln(1+\frac{x}{n})}{\frac{1}{n}} = -\infty$$

: divergent

(4) 
$$\lim_{n \to \infty} \frac{\ln \frac{n^2 - 4}{n^2 - 1}}{\frac{1}{n^2}} = \lim_{n \to \infty} \frac{\ln \left(1 - \frac{3}{n^2 - 1}\right)}{\frac{1}{n^2}} = -3$$

∴ convergent

(5) 
$$\ln a^{\frac{(-1)^n}{n}} = \frac{(-1)^n}{n} \ln a$$

 $\therefore \frac{1}{n}$  monotonically decreases to 0

$$\therefore \sum_{n=1}^{\infty} \frac{(-1)^n}{n} \ln a \text{ converges}$$

 $\therefore$  convergent

(6) : 
$$\prod_{k=1}^{n} \sqrt{\frac{k+1}{k+2}} = \sqrt{\frac{2}{n+2}} \to 0$$

: divergent

5 Due to convergence  $\lim_{n\to\infty} a_n = 0$ 

$$\tan(\frac{\pi}{4} + x) = 1 + Ax + o(x), A = \tan'(\frac{\pi}{4}) > 0$$

$$\therefore \lim_{n \to \infty} \frac{|\ln[\tan(\frac{\pi}{4} + a_n)]|}{|a_n|} = A$$

$$\therefore \sum_{n=1}^{\infty} \ln[\tan(\frac{\pi}{4} + a_n)] \text{ converges}$$

∴ convergent
